

UET Peshawar
Mini Project – IoT & Artificial Intelligence
Integration

Name: Syed Imam Ali Shah
Section: EEC C Section
Registration No: 25PWELE6537
Semester: 2nd

IoT & Artificial Intelligence Integration – Case Study

The Internet of Things (IoT) and Artificial Intelligence (AI) are transforming modern life. IoT devices collect data from the environment while AI analyzes this data and makes intelligent decisions. Together they create smart systems that improve efficiency, automation, and decision-making. A common example is a smart home. Devices such as smart lights, thermostats, cameras, and voice assistants gather real-time information. AI studies user behavior and automatically adjusts settings. Smart cameras can identify suspicious activities and send alerts. Smart thermostats learn user preferences and optimize energy usage. In healthcare, wearable devices monitor heart rate, blood pressure, oxygen levels, and sleep patterns. AI analyzes the collected information and helps detect health problems early. Remote patient monitoring reduces hospital visits and improves healthcare services. Industries use AI-powered IoT systems for predictive maintenance. Sensors monitor machine performance and AI predicts failures before they occur. This reduces downtime, saves money, and improves productivity. Smart factories also use these systems for quality control and inventory management. Benefits include automation, better decision-making, cost reduction, improved customer experience, energy efficiency, and enhanced safety. However, challenges such as cybersecurity risks, privacy concerns, high implementation costs, and device compatibility issues remain important. Future developments in 5G, edge computing, machine learning, and cloud technologies will further strengthen AI-enabled IoT systems. Smart cities, autonomous vehicles, and intelligent healthcare systems will increasingly rely on these technologies. In conclusion, the integration of AI and IoT is revolutionizing homes, industries, and healthcare. Despite existing challenges, the benefits are significant, and future advancements will make these systems more efficient and accessible. **References**
